JS Text File Merger – User Manual

Over View

JS Text File Merger is a small tool to merge or concatenate text files into one text file. This utility would be very in SQL scripting where you need to run many SQL scripts one by one in specific sequence etc. The use of this is not limited to this. One may merge any text files/data files using this.

Main Window

Target file path

The user should give a valid target file path to merge the selected files. If the user tries to merge files without giving a valid path, the user will be prompted for a file path.

Source File Path

In this version, the files to be merged should be placed in one folder. So select the path by selecting the **Drive** and browse the source file folder.

Available Files

When the folder is selected, the files in that selected folder will be listed in the **"Available Files"** list. These files include non text files as well. But please remember that the text file merger is only intended for text file merging.

Selecting the files to be merged

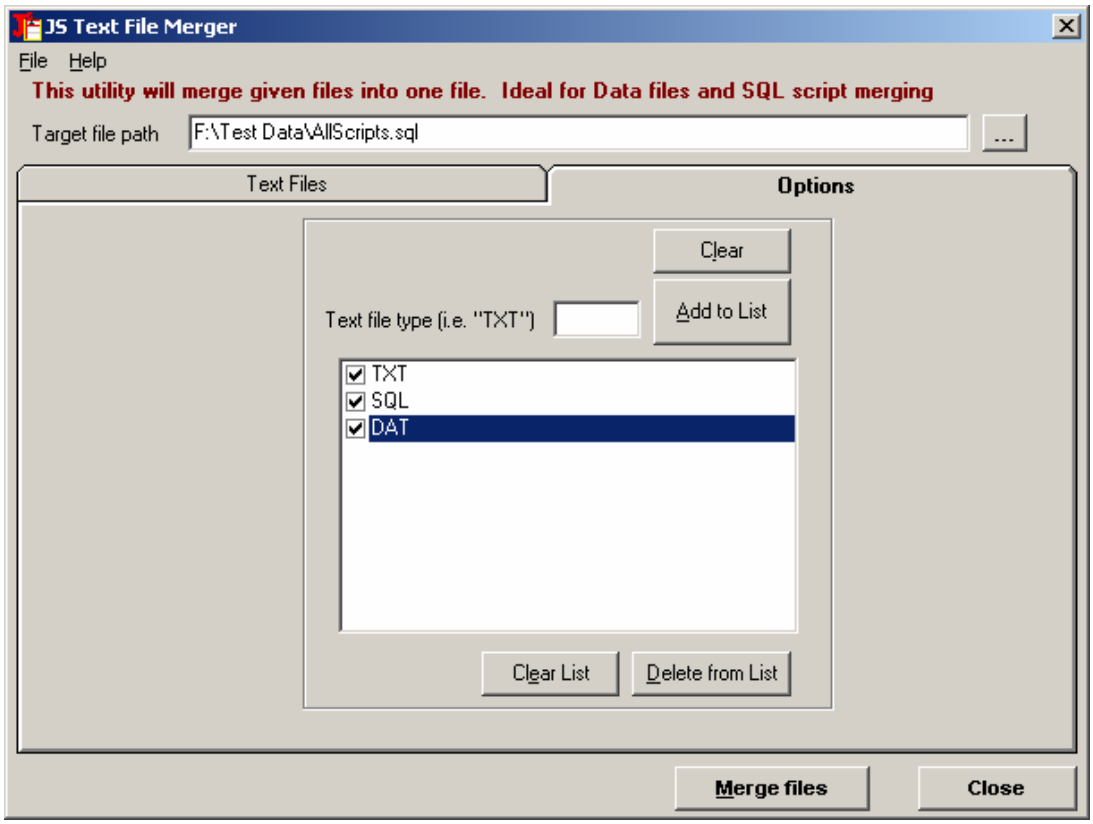

Now the user need to choose the files to be merged. Simply use the “Ctrl key + mouse click” to multi select the files. The user may move the mouse with left key pressed to select all files in the list. But there is a trick. Not all files are selected. The files which have the extensions specified in the “Option” panel are the only eligible candidates. Once a valid file is selected it is listed in the **“Files To”** list.

Arrange the Order of the files

Once the files are selected into the “Files To” list, the user can arrange the file’s position in the merging. The user can select a file in the **“Files To”** list and move it **“UP”** and **“DOWN”** using the arrow buttons on the right side.

A quick way may be select the file using the mouse right click and drag to the desired new position

Option Window

In the Options tab user can/should specify the file types he/she wants to consider. By default “TXT”, “DAT” and “SQL” extensions are included.

The user can add or delete any of these.

Text File Type

The user shall enter the extension in the given field. The maximum number of characters are limited to 4. For example “Java” and “html” are valid ones. But “.txt” is an invalid value. Please

note that the "." Should not be given. Once entered the file type and click the **"Add to List**" the new extension will added into the valid file type list.

Clearing the "Text File Type" filed

Clicking the button **"Clear"** will clear the contents of the **"Text File Type"** field. Clic

Clearing the "File Type List"

Clicking the button **"Clear List"** will clear the items in the valid file types list.

Remove a single File type

The user can select an item in the file type list and click the button **"Delete from List"** will remove the selected item from the list.

Finally, once all the files are selected and arranged in the desired order, **CLICK** the **"Merge files"** button to merge all the files into one file
